

In the Claims

1. (Previously Presented) A method for queuing traffic in a wireless network, comprising:

receiving a stream of packets for transmission in a wireless network, each packet including a flow identifier uniquely identifying the flow;

determining for each packet based on the included flow identifier a location for a corresponding flow, the location comprising a physical location of a mobile device in the wireless network;

assigning each packet to one of a plurality of virtual groups based on the location for the corresponding flow, the virtual groups comprising discrete transmission resources; and

queuing each packet in an assigned virtual group for transmission in the wireless network.

2. (Previously Presented) The method of Claim 1, further comprising:

determining for a packet based on the flow identifier a characteristic for the a corresponding flow, the characteristic comprising at least one of a wireless network parameter, a policy parameter for the flow, a flow parameter, and a power level for the flow; and

assigning the packet to a virtual group based on the location of the flow and the determined characteristic for the flow.

3. (Original) The method of Claim 2, further comprising inserting a label indicating the virtual group.

4. (Cancelled)

5. (Original) The method of Claim 1, further comprising:

determining for a packet based on the flow identifier a set of characteristics for a corresponding flow, the set of characteristics comprising the physical location of the flow, a wireless network parameter, a policy parameter for the flow and a flow parameter; and

assigning the packet to a virtual group based on the set of characteristics for the flow.

6. (Original) The method of Claim 5, further comprising inserting a label indicating the virtual group.

7. (Original) The method of Claim 5, the set of characteristics further comprising a power level for the flow.

8. (Cancelled)

9. (Cancelled)

10. (Cancelled)

11. (Previously Presented) The method of Claim 1, further comprising inserting a label indicating the virtual group.

12. (Previously Presented) The method of Claim 1, wherein the physical location comprises a sector in the wireless network.

13. (Previously Presented) The method of Claim 1, wherein the physical location comprises a latitude and a longitude of a mobile device associated with the flow.

14. (Previously Presented) The method of Claim 1, wherein the physical location comprises a specific beam within a sector of the wireless network.

15. (Original) The method of Claim 1, further comprising:
determining for a packet based on the flow identifier a wireless network parameter; and
assigning the packet to a virtual group based on the wireless network parameter.

16. (Original) The method of Claim 15, further comprising inserting a label indicating the virtual group.

17. (Original) The method of Claim 15, wherein the wireless network parameter comprises a sector layout.

18. (Original) The method of Claim 15, wherein the wireless network parameter comprises a frequency plan in the wireless network.

19. (Original) The method of Claim 15, wherein the wireless network parameter comprises a soft handoff percentage in the wireless network.

20. (Original) The method of Claim 15, wherein the wireless network parameter comprises an interference estimate in the wireless network.

21. (Original) The method of Claim 15, wherein the wireless network parameter comprises a sector power output in the wireless network.

22. (Original) The method of Claim 15, wherein the wireless network parameter comprises a noise threshold in the wireless network.

23. (Original) The method of Claim 1, further comprising:
determining for a packet based on the flow identifier a policy parameter for a corresponding flow; and
assigning the packet to a virtual group based on the policy parameter.

24. (Original) The method of Claim 23, wherein the policy parameter comprises a service level agreement (SLA) for the flow.

25. (Original) The method of Claim 23, wherein the policy parameter comprises a peak rate for the flow.

26. (Original) The method of Claim 23, wherein the policy parameter comprises a subscribed rate for the flow.

27. (Original) The method of Claim 23, wherein the policy parameter comprises a maximum burst rate for the flow.

28. (Original) The method of Claim 23, wherein the policy parameter comprises a packet size for the flow.

29. (Original) The method of Claim 23, wherein the policy parameter comprises a delay threshold for the flow.

30. (Original) The method of Claim 1, further comprising:
determining for a packet based on the flow identifier a flow parameter for a corresponding flow; and
assigning the packet to a virtual group based on the flow parameter.

31. (Original) The method of Claim 30, wherein the flow parameter comprises a type of the flow.

32. (Original) The method of Claim 31, wherein the flow parameter comprises a data flow identifier.

33. (Original) The method of Claim 30, wherein the flow parameter comprises a multi-slot/multi-code indicator for the flow.

34. (Original) The method of Claim 30, wherein the flow parameter comprises a power level for the flow.

35. (Original) The method of Claim 30, wherein the flow parameter comprises a multi-mode indicator for the flow.

36. (Original) The method of Claim 1, further comprising modifying the existence of virtual groups based on a dynamic status of the wireless network.

37. (Original) The method of Claim 1, further comprising defining the plurality of virtual groups to account for the impact of flows on the wireless network.

38. (Original) The method of Claim 1, queuing the packets in the assigned virtual groups comprising queuing the packets in a common memory with a virtual group identifier for each packet.

39. (Previously Presented) The method of Claim 1, the virtual groups including a plurality of class of service queues, further comprising:
determining a class of service for a packet; and
queuing the packet in a corresponding class of service queue in the assigned virtual group.

40. (Original) The method of Claim 39, queuing the packets in the assigned virtual groups comprising queuing the packets in a common memory with a virtual group identifier and a class of service identifier.

41. (Original) The method of Claim 39, wherein each class of service queue comprises a first in first out (FIFO) queue.

42. (Original) The method of Claim 1, further comprising individually metering packets in a virtual group to demote packets in excess of corresponding flow policies.

43. (Original) The method of Claim 1, further comprising dynamically controlling congestion in a virtual group based on available bandwidth for the virtual group in the wireless network.

44. (Previously Presented) The method of Claim 1, further comprising:
receiving an indication of available bandwidth for a virtual group;
generating congestion control parameters for the virtual group based on the indication of available bandwidth; and

dropping packets from flows in the virtual group based on the congestion control parameters.

45. (Original) The method of Claim 44, further comprising generating the indication of available bandwidth based on air-resource estimates.

46. (Original) The method of Claim 44, further comprising generating the indication of available bandwidth based on pricing strategy information.

47. (Original) The method of Claim 44, further comprising generating the indication of available bandwidth based on historical usage information.

48. (Original) The method of Claim 1, at least one virtual group including a plurality of class of service queues, further comprising individually controlling congestion for each of the class of service queues in the virtual group based on a dynamic status of the wireless network.

49. (Previously Presented) The method of Claim 1, further comprising:
assigning a packet for a corresponding flow in a first location to a first virtual group associated with the first location; and
in response to the flow device moving from the first location to a second location, assigning a subsequent packet for the flow to a second virtual group associated with the second location.

50. (Original) The method of Claim 49, further comprising requeuing the packet in the first virtual group into the second virtual group based on an original queuing time for the packet.

51. (Previously Presented) A system for queuing traffic in a wireless network, comprising:

a dynamic flow manager operable to receive a stream of packets for transmission in a wireless network, each packet including a flow identifier uniquely identifying the flow, to determine for each packet based on the included flow identifier a location for a corresponding flow, wherein the location comprises a physical location of a mobile device in the wireless network, and to assign each packet to one of a plurality of virtual groups based on the location for the corresponding flow; and

the virtual groups comprising discrete transmission resources each operable to queue assigned packets for transmission in the wireless network.

52. (Previously Presented) The system of Claim 51, the dynamic flow manager further operable to determine for a packet based on the flow identifier a characteristic for a the corresponding flow, the characteristic comprising at least one of a location of the flow, a wireless network parameter, a policy parameter for the flow, a flow parameter, and a power level for the flow, and to assign the packet to a virtual group based on the location of the flow and the determined characteristic for the flow.

53. (Original) The system of Claim 52, the dynamic flow manager further operable to insert a label indicating the virtual group.

54. (Cancelled)

55. (Original) The system of Claim 51, the dynamic flow manager further operable to determine for a packet based on a flow identifier a set of characteristics for a corresponding flow, the set of characteristics comprising the physical location of the flow, a wireless network parameter, a policy parameter for the flow, and a flow parameter, and to assign the packet to a virtual group based on the set of characteristics for the flow.

56. (Original) The system of Claim 55, the dynamic flow manager further operable to insert a label indicating the virtual group.

57. (Original) The system of Claim 55, the set of characteristics comprising a power level for the flow.

58. (Cancelled)

59. (Cancelled)

60. (Cancelled)

61. (Previously Presented) The system of Claim 51, the dynamic flow manager further operable to insert a label indicating the virtual group.

62. (Previously Presented) The system of Claim 51, wherein the location comprises at least one of a sector in the wireless network, a latitude and a longitude of a mobile device associated with the flow, and a specific beam within a sector of the wireless network.

63. (Original) The system of Claim 51, further comprising software stored on a computer-readable medium, the software comprising the dynamic flow manager and operable to implement the virtual groups.

64. (Original) The system of Claim 51, further comprising a preconfigured processor operable to implement the dynamic flow manager and the virtual groups.

65. (Original) The system of Claim 51, the dynamic flow manager further operable to determine for a packet based on the flow identifier a wireless network parameter and to assign the packet to a virtual group based on the wireless network parameter.

66. (Original) The system of Claim 65, the dynamic flow manager further operable to insert a label indicating the virtual group.

67. (Original) The system of Claim 65, wherein the wireless network parameter comprises a sector layout.

68. (Original) The system of Claim 65, wherein the wireless network parameter comprises one of a frequency plan and a frequency group in the wireless network.

69. (Original) The system of Claim 65, wherein the wireless network parameter comprises one of a soft handoff percentage and a soft handoff region in the wireless network.

70. (Original) The system of Claim 65, wherein the wireless network parameter comprises an interference estimate in the wireless network.

71. (Original) The system of Claim 65, wherein the wireless network parameter comprises a sector power output in the wireless network.

72. (Original) The system of Claim 65, wherein the wireless network parameter comprises a noise threshold in the wireless network.

73. (Original) The system of Claim 51, the dynamic flow manager further operable to determine for a packet based on the flow identifier a policy parameter for a corresponding flow and to assign the packet to a virtual group based on the policy parameter.

74. (Original) The system of Claim 73, wherein the policy parameter comprises a service level agreement (SLA) for the flow.

75. (Original) The system of Claim 73, wherein the policy parameter comprises a peak rate for the flow.

76. (Original) The system of Claim 73, wherein the policy parameter comprises a subscribed rate for the flow.

77. (Original) The system of Claim 73, wherein the policy parameter comprises a maximum burst rate for the flow.

78. (Original) The system of Claim 73, wherein the policy parameter comprises a packet size for the flow.

79. (Original) The system of Claim 73, wherein the policy parameter comprises a delay threshold for the flow.

80. (Original) The system of Claim 51, the dynamic flow manager further operable to determine for a packet based on the flow identifier a flow parameter for a corresponding flow and to assign the packet to a virtual group based on the flow parameter.

81. (Original) The system of Claim 80, wherein the flow parameter comprises a type of the flow.

82. (Original) The system of Claim 80, wherein the flow parameter comprises a data flow identifier.

83. (Original) The system of Claim 80, wherein the flow parameter comprises a multi-slot/multi-mode for the flow.

84. (Original) The system of Claim 80, wherein the flow parameter comprises a power level for the flow.

85. (Original) The system of Claim 80, wherein the flow parameter comprises a multi-mode indicator for the flow.

86. (Original) The system of Claim 51, the dynamic flow manager further operable to modify the existence of virtual groups based on a dynamic status of the wireless network.

87. (Original) The system of Claim 51, the dynamic flow manager further operable to define the plurality of virtual groups to account for the impact of flows on the wireless network.

88. (Original) The system of Claim 51, the virtual groups operable to queue the packets in assigned virtual groups by queuing the packets in a common memory with a virtual group identifier for each packet.

89. (Original) The system of Claim 51, the virtual groups including a plurality of class of service queues, the virtual groups further operable to determine a class of service for a packet and to queue the packet in a corresponding class of service queue in the assigned virtual group.

90. (Original) The system of Claim 89, the virtual groups further operable to queue the packets in the assigned virtual groups by queuing the packets in a common memory with a virtual group identifier and a class of service identifier.

91. (Original) The system of Claim 89, wherein each class of service queue comprises a first in first out (FIFO) queue.

92. (Original) The system of Claim 51, the virtual groups operable to individually meter packets and to demote packets in excess of corresponding flow policies.

93. (Original) The system of Claim 51, each virtual group operable to dynamically control congestion in the virtual group based on available bandwidth for the virtual group in the wireless network.

94. (Original) The system of Claim 51, each virtual group operable to receive an indication of available bandwidth for the virtual group, to generate congestion control parameters for the virtual group based on the indication of available bandwidth and to drop packets from flows in the virtual group based on the congestion control parameters.

95. (Original) The system of Claim 94, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on air-resource estimates.

96. (Original) The system of Claim 94, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on pricing strategy information.

97. (Original) The system of Claim 94, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on historical usage information.

98. (Original) The system of Claim 51, wherein at least one virtual group includes a plurality of class of service queues, each virtual group further operable to individually control congestion for each of the class of service queues in the virtual group based on a dynamic status of the wireless network.

99. (Original) The system of Claim 51, the dynamic flow manager further operable to assign a packet for a corresponding flow in a first location to a first virtual group associated with the first location and in response to the flow moving from the first location to a second location to assign a subsequent packet for the flow to a second virtual group associated with the second location.

100. (Original) The system of Claim 99, further comprising a mobility manager operable to requeue the packet in the first virtual group into the second virtual group based on original queuing time for the packet.

101. (Previously Presented) A method for controlling congestion in a wireless network comprising:

generating dynamic congestion control parameters for a wireless traffic queue based on a status of the wireless network, the status comprising either network loading or performance information;

dropping excess wireless packets destined for the wireless traffic queue based on the dynamic congestion control parameters; and

adding remaining wireless packets destined for the wireless traffic queue to the wireless traffic queue.

102. (Original) The method of Claim 101, wherein the status of the wireless network comprises available bandwidth in the wireless network.

103. (Original) The method of Claim 101, further comprising:

receiving available bandwidth in the wireless network; and

generating the dynamic congestion control panels based on the available bandwidth.

104. (Original) The method of Claim 101, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising generating the indication of available bandwidth based on air-resource estimates for the wireless network.

105. (Original) The method of Claim 101, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising generating the indication of available bandwidth based on pricing strategy information for flows in the wireless network.

106. (Original) The method of Claim 101, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising generating the indication of available bandwidth based on historical usage information for the wireless network.

107. (Original) The method of Claim 101, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising generating the indication of available bandwidth based on interference information for the wireless network.

108. (Original) The method of Claim 101, the wireless transmission queue comprising a plurality of class of service queues, further comprising individually controlling congestion for each of the class of service queues based on the status of the wireless network.

109. (Original) The method of Claim 101, wherein the status comprises a real-time status of the wireless network.

110. (Original) The method of Claim 101, wherein the status comprises an average status of the wireless network over a defined period of time.

111. (Previously Presented) A system for controlling congestion in a wireless network comprising:

a wireless traffic queue;

a control parameter generator operable to generate dynamic congestion control parameters for the wireless traffic queue based on a status of a wireless network, the status comprising either network loading or performance information; and

a congestion controller operable to drop excess wireless packets based on the dynamic congestion control parameters and to add remaining wireless packets destined for the wireless traffic queue to the wireless traffic queue.

112. (Original) The system of Claim 111, wherein the status of the wireless network comprises available bandwidth in the wireless network.

113. (Original) The system of Claim 111, the control parameter generator operable to receive an indication of available bandwidth in the wireless network and to generate the dynamic congestion control parameters based on the indication of available bandwidth.

114. (Original) The system of Claim 111, wherein the status of the network comprises an indication of available bandwidth, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on air-resource estimates for the wireless network.

115. (Original) The system of Claim 111, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on pricing strategy information for flows in the wireless network.

116. (Original) The system of Claim 111, wherein the status of the wireless network comprises an indication of available bandwidth, further comprising a dynamic bandwidth estimator operable to generate the indication of available bandwidth based on historical usage information for the wireless network.

117. (Original) The system of Claim 111, the wireless transmission queue including a plurality of class of service queues, the congestion controller further operable to individually control congestion for each of the class of service queues based the status of the wireless network.

118. (Original) The system of Claim 111, further comprising software stored on a computer-readable medium, the software comprising the control parameter generator and the congestion controller.

119. (Original) The system of Claim 111, further comprising a preconfigured processor operable to implement the control parameter generator and the congestion controller.

120. (Previously Presented) A method for queuing traffic in a wireless network, comprising:

queuing a packet for a corresponding flow to a first location in a wireless network in a first queue associated with the first location; and

in response to the flow moving from the first location to a second location, requeueing the packet in the first queue into a second queue associated with the second location based on an original queuing time for the packet.

121. (Original) The method of Claim 120, further comprising queuing the packet in a common first in first out (FIFO) memory with a queue identifier.

122. (Original) The method of Claim 121, further comprising requeueing the packet from the first queue to the second queue in the FIFO memory by changing the queue identifier for the packet from the first queue to the second queue.

123. (Previously Presented) A system for queuing traffic in a wireless transmission system, comprising:

a queue manager operable to queue a packet for a corresponding flow to a first location of in a wireless network in a first queue associated with the first location; and

a mobility manager operable, in response to the flow moving from the first location to a second location, to requeue the packet in the first queue into a second queue associated with the second location based on an original queuing time for the packet.

124. (Original) The system of Claim 123, the queue manager further operable to queue the packet by storing the packets in a common first in first out (FIFO) memory with a queue identifier.

125. (Original) The system of Claim 124, the mobility manager further operable to requeue the packet from the first queue to the second queue by changing the queue identifier for the packet from the first queue to the second queue.

126. (Original) The system of Claim 123, further comprising software stored in a computer-readable medium, the software comprising the queue manager and the mobility manager.

127. (Original) The system of Claim 123, further comprising a preconfigured processor operable to implement the queue manager and the mobility manager.

128. (Previously Presented) A peripheral card for a mobile gateway, comprising:
an external interface operable to receive a stream of packets for transmission in a wireless network, each packet including a flow identifier uniquely identifying the flow;
a dynamic flow manager operable to determine for each packet based on the included flow identifier a location for a corresponding flow, wherein the location comprises a physical location of a mobile device in the wireless network, to assign each packet to one of a plurality of virtual groups based on the location for the corresponding flow, the virtual groups comprising discreet transmission resources; and
an internal interface operable to forward the packets to the assigned virtual groups for queuing.

129. (Original) The peripheral card of Claim 128, the dynamic flow manager further operable to add a virtual group label to each packet identifying the assigned virtual group.

130. (Original) The peripheral card of Claim 128, further comprising a dynamic bandwidth estimator operable to generate an indication of available bandwidth for each of the virtual groups.

131. (Original) A quality of service (QoS) card for a mobile gateway, comprising:
a plurality of virtual groups;
each virtual group including a meter and an adaptive congestion controller;
the meter operable to meter packets in the virtual group and demote packets in excess of
corresponding flow policies; and
the adaptive congestion controller operable to dynamically control congestion in the
virtual group based on available bandwidth for the virtual group in the wireless network.

132. (Original) The QoS card of Claim 131, further comprising a mobility manager
operable to requeue a packet in a first virtual group into a second virtual group based on original
queuing time for the packet in response to a corresponding flow moving from a location
associated with the first virtual group to a location associated with the second virtual group.
